The model takes into account factors including the age of a rating, whether the ratings are from verified purchasers and factors that establish reviewer trustworthiness. Sorry, we failed to record your vote. Please try again I wasnt expecting it to be an overly exceptional product, but I was surprised when I hooked it up. The best picture, obviously, will come out of a smaller projection, but in my class it projects a 3 foot by 5 foot image pretty well. So, over all, here are the great things about this little product It doesnt tell you in the description that this comes with almost all the hook ups you need for the TV and computer projection which was a nice surprise. It also comes with a very little spiderlike stand to hold it and converters to charge it for those that travel out of the country. Its too bad that I didnt know that and ordered all the chords anyway. Its quiet. It can work on battery power for over an hour, but you can also choose to plug it in. It is a REALLY EASY set up. Literally, all you have to do is plug it in and click a button after turning it on. Projecting from an Apple and then later from an IBM was the same. It works fine with both. I have NOT tried it from my ipod or blackberry yet though because there are no hook ups for these products with it. Though you need a dark room to get the full quality of the picture, it is good for presentations, movies darker ones like the newest version of Christmas Carol were a little problematic, but worked fine, video games, and other short viewings. it is tiny. Really, it is less than a pound. I love that the most about this product. It is so easy to travel with. Its the size of 2 cell phones. Overall I am thrilled with the product. I bought it used and only spent 150 on it. I think it was well worth it.Sorry, we failed to record your vote. Please try again That being said, this is a great little projector.

It is small and compact can fit in your pocket and does a very nice job presenting so long as your room is dark the darker the better. It does not have many lumens, but for what it has, I was very, very pleased. A couple of notes that I have found out as I have played with it First of all, while you can project onto a wall, you can get more out of this little guy if you have a good screen especially if you have a screen that has the small glass beads impregnated in the fabric to brighten it up. The

little tripod it comes with is convenient, but not as stable as I would like. I have a regular tripod that I use with this for presentations, though I have found that the screw from my tripod is longer than the depth of the socket on the projector. I solved this problem by carrying a washer along with me to put between the projector and tripod. That effectively shortens the length of the screw so you can get it tight. Don't plan on using the built in speakers unless you absolutely must. I either carry speakers along with me preferred or use my laptop speakers. You are buying this for portability, not for a surround sound presentation. There is a little cooling fan in this projector that can get kind of noisy. One of the people recently commented to me that it sounded like it was firing photon torpedoes. It is easily tuned out in my opinion, though I suppose some would be distracted by it. Remember, this is not for large rooms, but for small presentations. Some of the reviews have spoken of up to 50 people, I would suggest that this is ideal for a conference room where 10 folks are gathered around a table. Because the lumens are low, when dark slides or movie clips are shown, it tends to be kind of hard to see definition, but I have seen larger projectors with much higher lumen ratings have this problem as well. There is a brightness control, but it only has two settings.

Were I to suggest improvements, I would say, increase lumens, deepen the socket for the tripod stand, and drop the speakers. I have spent the last several years lugging a heavy projector and case with me when I needed to make a presentation. Those days are effectively over! Sorry, we failed to record your vote. Please try again I was looking for something small and portable that I could set up easily and enjoy a flick or two while deployed to Afghanistan in the Army. This little gizmo was all that and then some. Being deployed you have very little space to lug things around and even littler space to call your own. This thing is about the size of a deck of cards only a little longer. I got it very quickly only about a week after I ordered it which really says a lot considering where I am currently located on the map!!! It was a breeze to set up, which means all I did was plug it into the computer and the wall and it was ready. It has about a 2 hour battery once you charge it up which is great for when the power goes out and you want to finish your movie or whatever you're doing. My only complaint is that the screen is a little dark at times but hey for 150 bucks you can't go wrong in my opinion. I've used this to do some training via power point and it works great. I don't know if the lights will last for 20,000 hours like it says but I will definitely put it to the test. It could use a longer cord for connecting to the computer but the one it comes with works just fine if you don't mind having the projector within 2 feet of your computer. Basically I don't have anything bad to say it works great for the stuff that I use it for and would recommend it for any soldier who is deployed its cheap and works just fine. Sorry, we failed to record your vote. Please try again It was worth the money I spent. The projector has built in speakers, but they are pretty much worthless.

I have a hard time imagining a situation where they would actually be used versus actually hooking up a set of computer speakers to the video source device. My biggest problem with this unit is that it does not have a keystone option. You have to place the projector at 90 degrees to the screen or get image distortion. For the still images I will be projecting I imagine that I will be able to predistort them as a work around, but it is going to take me some figuring to do. For video Maybe there are programs to do that with your video feed, but I'm not aware of them. Sorry, we failed to record your vote. Please try again I think a lot of the negative reviews come from people who believe that it should compete with larger LCD projectors. But in the product information, it clearly says that it is not meant to replace a fullroom projector. So having said that, for my purposes, this projector is great. I am using it in a dark room with 810 people and it works perfectly I haven't tried out the speakers yet. The video is clear and bright. It's not gonna knock anyone's socks off, but it works well. If you need a small projector for a small audience, this will work great for you. You can't beat the price. Sorry, we failed to record your vote. Please try again Good for small business meetings and parties. Sorry, we failed to record your vote. Please try again Sorry, we failed to record your vote. Please try again I've been using for a few years now. I bought it initially to use when painting a mural. Worked well for that. Now I use it on a tripod to project movies on the wall in my bedroom.

Not great for media. It isn't bright enough and the color is way too dark. Sorry, we failed to record your vote. Please try again Easy to set up, fun to use. Sorry, we failed to record your vote. Please try again The best picture is when the room is dark of course but can be seen with some lighting.

I read a lot of reviews about the Mpro120 there were many that rated this product low and said it just didn't work. This is not the case for me I was so amazed with the picture I am ordering 2 more. This does not project in HD but gets the job done and even my 7 year old can set it up. Great for movies and watching TV at night. This really works great the only thing I would look at is sound you may want to buy something else to plug your audio into the speaker is ok but I thought it would be better to buy the kids a surround sound for their room. Sorry, we failed to record your vote. Please try again The challenging part is the length of the cords given that you need to place the projector far from the computer to get a large enough image and to balance the small unit at the correct height. Still, it is a marvel for the size and price and I don't regret the purchase. It's great for impromptu presentations. Sorry, we failed to record your vote. Please try again I've only had it for a few weeks but it works very well. I've had no problems with it so far. The hookup was very easy for me. It is very compatible with the MacBook laptop. I also appreciated all the different hookup attachments that came with this projector. If you cannot get connected one way, it comes with several different plugins to ensure connectivity to your equipment. I've watched several movies with this projector. It does require a very dim room for viewing. So, the darker the room the better it shows. The challenge that I have is adjusting the height for viewing. I would recommend the spider tripod or something that's adjustable for height. To me, the picture clarity is comparable to your analog TV or better. Sorry, we failed to record your vote. Please try again My only negative is that the room needs to be TOTALLY dark for it to work well. Otherwise, this small pocket projector is great. It has lasted five years, and shows no sign of giving up. Have not needed to replace the bulb yet.

The sound quality is poor, but I have external speakers for that. Sorry, we failed to record your vote. Please try again The primary purpose of this is to deliver impromptu presentations to a very small number of people 12. Looking over my shoulder on my laptop isn't very practical. Once I received the product, I charged it up and projected from my macbook pro onto my kitchen refrigerator. The brightness was actually a lot better than I expected I guess I had doubts and low expectations. As noted, this is in no way, able to replace a conference room projector. You should speak to the slides, and not read or have your viewers read. Keep the presentation simple! Sorry, we failed to record your vote. Please try again. If you want us to review it drop us a line and we just might bump it to the front of our reviews queue. That's okay though because you can add your own review and we'll feature it here. Amazon calculates a product's star ratings based on a machine learned model instead of a raw data average. The model takes into account factors including the age of a rating, whether the ratings are from verified purchasers, and factors that establish reviewer trustworthiness. See All Buying Options Add to Wish List Disabling it will result in some disabled or missing features. You can still see all customer reviews for the product. I wasn't expecting it to be an overly exceptional product, but I was surprised when I hooked it up. I think it was well worth it. Reviewed in the United States on January 19, 2015 Works pretty well for the price and size, I guess. I've been using for a few years now. It isn't bright enough and the color is way too dark. Just try using one in a public space—connecting it to a camera to show a friend some photos, say—and see what happens. You'll quickly find that it's high on the list of gadgets that encourage total strangers to come over and start conversations. It's similar in many ways to the first-generation MPro110 that it replaces, but mostly better. The reason for the qualification—that the MPro120 is mostly better—is that despite some clear improvements, like a boost in brightness, 3M has made a fundamental change in the engine that arguably hurts as much as it helps. The new engine uses red, green, and blue LEDs in sequence, as in TI's DLP-based engine—which you'll find, for example, in the Optoma Pico PK101. SEE ALSO [The Best Portable Projectors for 2020 According to 3M](#), using red-green-blue LEDs gives the MPro120 richer colors. Unfortunately, it also gives it something called the rainbow effect, with light areas of the image breaking up into little red-green-blue rainbows when objects move on screen or you shift your gaze. Some people can easily ignore it, while others find it annoying. If you fall into the second category, you'd probably be willing to do without the richer colors in exchange for not having the rainbow effect. I'm relatively sensitive to it, and I noticed the breakup repeatedly throughout my testing. However, it's far from the worst example I've seen, and I consider the effect tolerable for the MPro120, even though I'd be happier not to see it at all. The front of the projector is defined by the lens and a focus thumbwheel along one of the 2.4-inch sides. The back offers a power input and a proprietary connector to let you plug in one of the supplied cables for a computer and video source. To actually use the projector, simply plug in a cable, turn on the power, and point the lens towards whatever you want to use as a screen.
